The Truth About Weather Manipulation: Yes, It Can Be Done And Yes, It Has Been Done For Well Over A Century, And Now Being Done To Unprecedented Levels

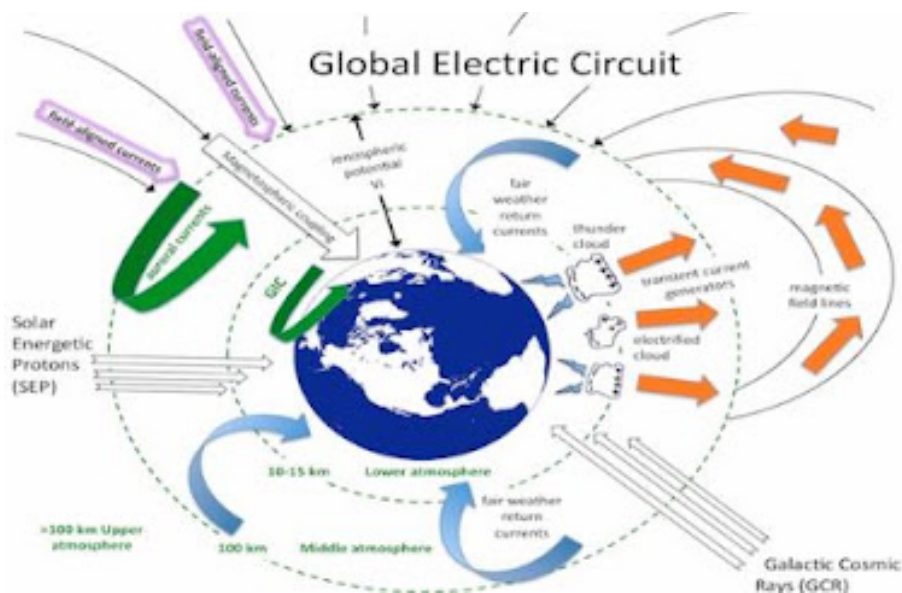

By [Alan Barton - All News Pipeline](#)

Many stories have been written about how “*they*” (whomever “*they*” really are) manipulate the weather (and I have authored a few myself), but there exists a few ideas that should be presented to help those with still lingering doubts on all of it see things a bit different and with a modicum of reasoning to help them really appreciate how it can be done.

Yes, it can be done and yes, it has been done for well over a century now, and yes it is now being done to unprecedented levels.

Don't worry, we will be coming back to the primary topic, but first a bit of background must be set in order to help this thought train make sense. In our previous column we covered a bit about the Schumann Resonance and how it is so closely tied to our Sun because of the electromagnetic energies involved and see how that relates to the topic at hand. Now let's look briefly at how our Earth's electric system operates.

The Global Electric Circuit basically describes the movement of electrical energies around our sphere and although it is a fairly new study with a lot still to be learned, we cannot neglect what we do know already.

Our ionosphere, the uppermost portion of our atmosphere, is up about 30 miles or 50 Km on the daytime side of our planet and about double that on the night time side and is about 1% plasma which is that state of matter where electrons are stripped from the atom. During a space weather event (which we are currently under) the ionosphere gets more highly charged from outer space (mostly from our Sun) which generates more plasma and a much stronger global electric current which affects the weather we see in our troposphere which is where we live. The coronal hole emissions we are having right now is a major cause of our current weather and electric circuit energies.

In a thunderstorm there is a charge differential from top (positive charge) to the bottom (negative charge) that causes precipitation and lighting discharges, point current discharges, cloud to cloud discharges, transient luminous events (TLE's) that go up from the clouds to the ionosphere, gigantic Gents or Sprites and a number of other plasma phenomenon. Most of the resistance in between the

ground surface and the ionosphere is in the boundary layer which is the top one and a half to two miles. Once you get above that the conductivity increase quite a bit, lets say about 3 to 6 or so miles up.

Our ground, the earths surface, is fairly conductive and the upper regions of our atmosphere are as well, with that resistive area in between something like seven orders of magnitude more resistive. Data from research indicates that the most important aspect of the global electric circuit is the conductivity of the atmosphere so when that conductivity changes the global electric circuit also changes. And just what is a circuit? As your high school classes should have taught you is that to have a circuit you need a flow of energy through all parts of that circuit. Think of turning off the light switch to disrupt the flow of electricity to your light bulb.

The flow of the electricity, lets call it the rate of the current flowing through the circuit, is determined by the most resistive part. So if the atmosphere becomes more conductive, there will be a lot more energy, more current flowing through that circuit. A normal thundercloud can have potential of say, fifty or a hundred or more mega-volts while the ionosphere can have a potential of 250,000 volts. The difference between 250Kv and 100Mv is massive, with the atmosphere and the ground surface basically neutral or slightly negative in its charge in comparison.

In a fair weather scenario you have these currents slowly equalizing with sunlight hitting the ionosphere, and space weather effects that will keep the charge in the ionosphere stable. During a space weather impact the ionosphere can raise to 350, maybe 400 Mega Volts or higher especially in the polar regions (where the Auroras are a testament to that happening).

Now put that thunderstorm cloud in the mix and we have very strong electric currents which is shown in these various transient events going up such as that gigantic plasma jet bursting up as shown in the TLE photograph below taken from the International Space Station on July 3rd, 2025 over the Texas to Mexico region from the remnants of tropical storm B (which would have been Hurricane Beryl if it had reached high enough wind speeds). That discharge instantly linked the clouds to the ionosphere resulting in that beautiful but very potent show of energy.

TLE – transient luminous event - massive plasma discharge jet from cloud level to the ionosphere

When you start to alter the global electrical circuit of our planet and increase the current flows, these types of things are going to get stronger. Our global electrical currents really are getting stronger and it is not all from our Sun's input but from numerous other impacts generated by both man and nature here on our surface. When we are talking about weather modifications we must understand the global electric circuit to see what is happening.

The below image is from a NOAA Weather Modification Project Report page that shows just three of the weather modification reports submitted to NOAA for the surrounding region of the Texas July 4th storm that killed so many victims.

As required by that law, NOAA submitted a [Report to Congress](#) in 1979, available via the NOAA Library.

Below is a list of these reports and is updated on a quarterly basis.

Show 10 entries Search: Texas

Search Project Designation	Search Project Number	2025	Search Activity
Texas Panhandle Groundwater	2025TXTPH-1	4/1/2025-9/30/2025	Rain enhancement

West Texas Weather Modification	2025TXWT-1	3/15/2025-10/31/2025	Rain enhancement, hail suppression

Due to the globalists war on truth, ANP must depend on [reader donations](#) to keep the website active.

Anything ANP readers can do to [help](#) is greatly appreciated.

Another thing to keep in mind is how moisture in the atmosphere affects things. Remember that it is the water content in many things that heats up to cook in the microwave and not the dry matter. Clouds are affected more by high RF radiation levels than dryer areas, heating up much faster and therefore absorbing more energy in the process. Cell phone frequencies are in the range of high UHF to mid microwaves and the higher the frequency the more energy it takes to keep a desirable distance reliability factor. Depending on the bandwidth, 5G towers usually run in the neighborhood of 150 watts to 500 watts output power PER Channel. And note how many towers are in any observable area and how many channels per tower are in use at any given time (two channels per phone) can be guessed by how many cell phones are connected at any specific point. Also realize that every phone requires TWO connection channels to operate. One relatively narrow banded for simple data (like texting) and linking control, the other far more wide banded to allow much higher data rates for voice/data (think internet for this data link).

We have covered before how badly this frequency range and output powers affects the human body, especially the mind. The energy levels being input to the global electrical circuit is immense in total, and in a very wide ranging area. But that pales in comparison to what the NexRad weather radars are doing overall.

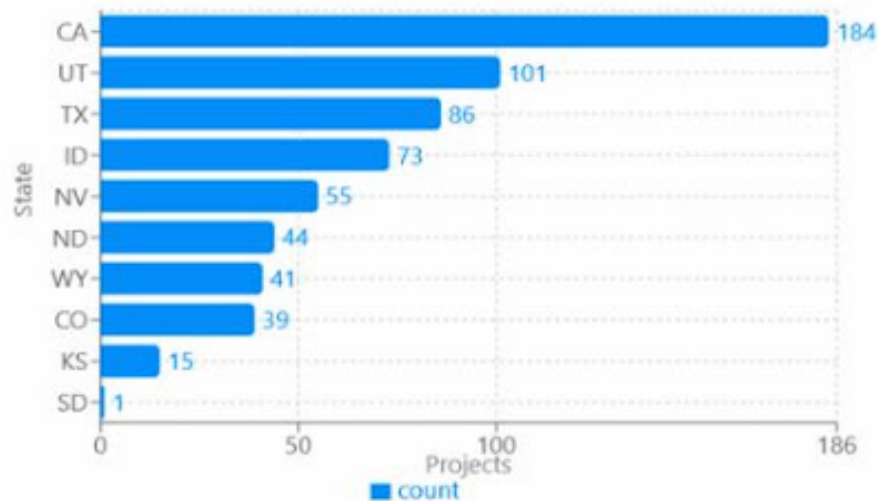

Below is from "[Radiation: A Central Component of Weather Control](#)"

Microwave radiation is utilized for weather experimentation and forecasting.

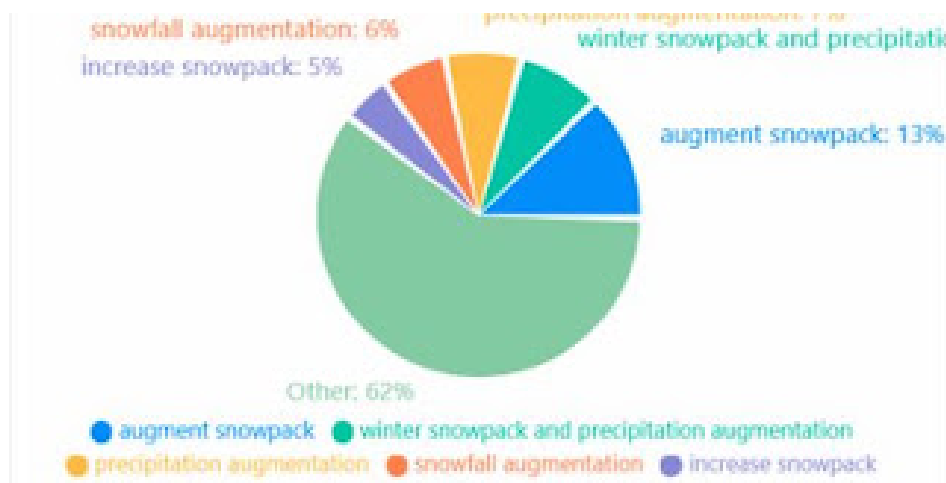

Did you know radiation is a central component of weather control?

At the heart of weather experimentation is NEXRAD, or NEXt-generation RADar and the transmission of microwave radiation pollution.

The cell phone you hold in your hand and the cell phone towers it's communicating with are transmitting and receiving microwave radiation.

Please notice the high ranking of Texas in weather modifications while still only half the rate of California. And note where Utah ranks – *we just gotta support those ski trails folks* (in need of taxes paid by those guys). And Utah is still the only state with 100% drought conditions designated officially.

MonkeyWerx videos have shown recent massive increases in weather mod aircraft over the storm areas hit by the deadly Texas floods just prior to that flooding along with so many other destructive storms the past few years of aircraft tracking. This is not some random effect, it was planned and the NexRad tower graphics prove it.

Cloud seeding is the primary method utilized for this, and that is only a portion of the real contaminates added to our atmosphere in the quest for more rain. Well, officially for rain but we all know it also includes a reduction in sunlight hitting our planet in an outrageous effort to change the weather while ignoring the altitude where that actually occurs (at a far too low of an altitude in general, negating their quest for believability) and where the most energy transfers happen as we discussed above. Gates and company (as an example) of poisoning our atmosphere to reduce sunshine hitting us are vitriolic liars. Sure, they spray our air with contaminates to reduce the solar energy hitting the

surface of our planet but that actually pales in comparison with what is emitted by the newer refined jet fuels and *especially* their ever increasing additives. Aluminum particles are only a small part of it along with other heavy metals harmful to just about everything (which also poisons our farmlands, our water supplies, oceans etc.) and they are also showing up in increasing contamination levels in our food and water supplies.

And more importantly, ***they add to the conductivity of our troposphere*** further modifying our global electric circuits. And they also increase the effectiveness of what the NexRad radars and HAARP energy injections upon our natural electric systems.

If any of the following three short video clips do not open when clicked, just copy the URL and paste into your browser. That should work (it does for me).

[Video of BLUE RAIN falling from the sky all over TEXAS \(27 seconds\)](#)

[Video of catastrophic flooding in Kerrville Texas \(40 seconds\)](#)

[Clip showing NexRad weather radar affecting thunderstorms in Texas \(43 seconds\)](#)

NOAA Weather Modification Project Report — South Texas WMA — Rain Enhancement

Please note the right hand area of the above SR graph, those markings that are below the normal natural range is MAN MADE and occurred a day before the Texas July 4th flooding. This is the result of possibly the HAARP array or perhaps the NexRad towers focusing their energies in the region. A “normal” graph is below for comparison (live feed capture on July 9th)

NexRad weather stations produce 750 KILOWATTS of power each. That is 750 thousand watts. They need to get that power out a long ways and reflect off of the moisture in the air to map out storms. There are 159 of these S band (2 to 4 Gigahertz – microwave radiation) Doppler radar stations across the continental USA. Your kitchen microwave operates at 2.450 Gigahertz, right where

the weather radars do. The average microwave oven operates at about 600 to 1200 watts maximum, with the average kitchen one about 1,000 watts and they are very well shielded against emitting deadly radiation into your kitchen to avoid frying your brain. Even with the inverse geometric of radiation reductions, those NexRad radar sites push out a hell of a lot of very deadly radiation and make a very significant contribution to the forming, directing and retarding of storm cells. Along with the HAARP (VLF mostly, already covered very well the past couple of decades) and the fluctuations in solar energy being directed at us there is no question that storms have been getting deadlier and deadlier. Yes, there have been many historic storms with devastating results, but the frequency and increasingly common seen ones that once were rare and uncommon are truly Biblical in nature.

I find it most fascinating that our Creator would use our own technology along with His controls over our Solar governing body to inflict the prophesied destruction's of the last days upon us. Yes, most fascinating.
